

For the calendar module (and the EventList Latest Events module for Upcoming events) you can now create multiple copies and set them to filter by category and/or venue.

When you install the calendar module - you will find the module in your administrator panel module manager.

If you select the module and then select Copy you can create a second copy of your module.

Having created another copy, you can now change all it's parameters - Name, Which menu items / pages it is displayed on, which categories to filter by etc.

To filter on one or more Categories - enter their numeric IDs separated by commas into the Category ID box.

You can find the Category IDs by going to Eventlist Component / Categories and there you will find the numeric ID's associated with each category.

You can do this for venues in a similar way.
